

Neural Networks Types and Main Features

Feedforward neural network connections between nodes do not have a cycle

Multilayer perceptron (MLP) has at least three layers of nodes

Recurrent neural network (RNN) connections between units have a directed cycle

Self-Organising Maps (SOM) convert input data to low dimensional space

Deep Belief Network (DBN) has connections between layers but not within layer

Convolutional Neural Network (CNN) has one or more convolutional layers and then followed by one or more fully connected layers

Generative Adversarial Networks (GAN) system of two neural nets, contesting with each other

Spiking Neural Networks (SNN) time information is processed in the form of spikes and there is more than one synapse between neurons

Neural Networks Types and Main Features (cont)

Wavelet neural network use wavelet function as activation function in the neuron

Wavelet convolutional neural network combine wavelet transform and CNN

Long short-term memory (LSTM) type of RNN, model for the short-term memory which can last for a long period of time

Building Neural Network with Keras and Python

```
from keras.models import Sequential
model = Sequential()
from keras.layers import Dense
model.add(Dense(units=64, activation='relu', input_dim=100))
model.add(Dense(units=10, activation='softmax'))
model.compile(loss='categorical_crossentropy', optimizer='sgd', metrics=['accuracy'])
model.compile(loss='keras.losses.categorical_crossentropy', optimizer=keras.optimizers.SGD(lr=0.01, momentum=0.9, nesterov=True))
model.fit(x_train, y_train, epochs=5, batch_size=32)
model.train_on_batch(x_batch, y_batch)
```

Building Neural Network with Keras and Python (cont)

```
> loss_and_metrics = model.evaluate(x_test, y_test, batch_size=128)
classes = model.predict(x_test, batch_size=128)
```

Keras

Data Preparation for Input to Neural Network

```
from sklearn import preprocessing
def normalize_data(m, XData):
    if m == "":
        m="scaling - no"
    if m == "scaling-no":
        return XData
    if m == "StandardScaler":
        std_scale = preprocessing.StandardScaler().fit(XData)
        XData_new = std_scale.transform(XData)
        if m == "MinMaxScaler":
            min_max_scale = preprocessing.MinMaxScaler().fit(XData)
            XData_new = minmax_scale.transform(XData)
        return XData_new
```

Cheat Sheets about Python and Machine Learning

Quick and Easy Way to get started with common and most used python tasks in data processing

Neural Network Applications and Most Used Networks

Image classification	CNN
Image recognition	CNN
Time series prediction	RNN, LSTM
Text generation	RNN, LSTM
Classification	MLP
Visualization	SOM

Neural Net Weight Update Methods

Adam	based on adaptive estimates of lower order moments
AdaGrad	Adagrad is an adaptive learning rate method
RMSProp	adaptive learning rate method, modification of Adagrad method
SGD	Stochastic gradient descent
AdaDelta	modification of Adagrad to reduce its aggressive, monotonically decreasing learning rate
Newton method	second order method, is not used in deep learning
Momentum	method that helps accelerate SGD in the relevant direction

Neural Net Weight Update Methods (cont)

Nesterov accelerated gradient	evaluate the gradient at next position instead of current
-------------------------------	---
